		EDF TRADING	Energy Traders Europe	
Intrady Capacity Allocation Rules between France and Switzerland	Main message	We overall suppport the switch to 15min for the French Swiss border	We welcome the initiative to switch to a 15-minute market time unit in the intraday timeframe on the French-Swiss border. This reflects recent developments brought within the European Internal Energy Market and provides finer granularity, contributing to better integration of renewable energy sources and more efficient use of cross-border transmission capacity.	RTE and Swissgrid aknowledge the good feedback from the Market Participants on the amendments to the Intraday capacity allocation rules.
Intrady Capacity Allocation Rules between France and Switzerland	Section iV, article 4.02	We support the idea to open the CAP at 18:00 D-1 (instead of 21:05)	We support the opening submissions for capacity earlier as we consider it a positive development.	RTE and Swissgrid aknowledge the good feedback from the Market Participants on the amendments to the Intraday capacity allocation rules.
Intrady Capacity Allocation Rules between France and Switzerland	Allocation for transactions on RTE's balancing mechanism	On several sections of the rules, all the timings related to the RTE balancing mechanism at the Swiss border seems wrong. Initially, the neutralization time for this is 30min before delivery (while it is 60min for the Standard Intraday Allocation). With this new version, it seems the neutralization time for the balancing is now 60min (instead of 30). Can you please explain why, clarify ?		In last version 1.4 from 2020, neutralization time for RTE balancing mechanism was already 60 min, as you can see in the version attached. What is seen in Track change mode is an old change.
Intrady Capacity Allocation Rules between France and Switzerland	Implementation timeline		We support the communicated implementation date of February 18, 2026 and we encourage a timely implementation.	RTE and Swissgrid aknowledge the good feedback from the Market Participants on the amendments to the Intraday capacity allocation rules.
Intrady Capacity Allocation Rules between France and Switzerland	Next steps and communication		We request additional insights on the foreseen actions between consultation closure and go-live so that market participants can be better prepared for the transition.	Next step would be to submit the final version of the rules to NRAs, expected to be in January 2026. The new version of tool to be used with 15minMTU on FR-CH border is already available for Market Participants in test environment of DBAG platform. Market Participants can thus already prepare themselves for go live in February 2026. Communication will be done by RTE and Swissgrid to announce the go live, at least one week in advance.
